# Transplication as Implication 

Simon D'Alfonso

February 24, 2010

In his contribution on partial logic to the Handbook of Philosophical Logic [m], Stephen Blamey introduces a 'value gap introducing' connective named 'transplication' (/) to the standard 3 -valued partial logic, the Strong Kleene logic. Where $t$ stands for 'true', $f$ stands for 'false' and $n$ stands for 'neither true nor false', the truth table for this connective is:

| $/$ | 1 | $n$ | 0 |
| :---: | :---: | :---: | :---: |
| 1 | 1 | $n$ | 0 |
| $n$ | $n$ | $n$ | $n$ |
| 0 | $n$ | $n$ | $n$ |

Blamey suggests the possibility of reading the transplication connective as a type of conditional. Basically, the idea is that conditional sentences of the form 'if $A$ then $B$ ' are neither true nor false when $A$ is false. They are also neither true nor false when either $A$ or $B$ is neither true nor false. I was interested to see how the transplication connective fares as a conditional by testing it against a list of inferences concerning conditionals. Here are the results:

| $(1) q \vDash p / q$ | $\times$ |
| :--- | :---: |
| $(2) \neg p \vDash p / q$ | $\times$ |
| $(3)(p \wedge q) / r \vDash(p / r) \vee(q / r)$ | $\checkmark$ |
| $(4)(p / q) \wedge(r / s) \vDash(p / s) \vee(r / q)$ | $\sqrt{ }$ |
| $(5) \neg(p / q) \vDash p$ | $\checkmark$ |
| $(6) p / r \vDash(p \wedge q) / r$ | $\times$ |
| $(7) p / q, q / r \vDash p / r$ | $\checkmark$ |
| $(8) p / q \vDash \neg q / \neg p$ | $\times$ |
| $(9) \vDash p /(q \vee \neg q)$ | $\times$ |
| $(10) \vDash(p \wedge \neg p) / q$ | $\times$ |

## Paraconsistent Transplication

What would the transplication connective look like when added to the 3 -valued $\mathbb{L P}$ (Logic of Paradox), which treats the third truth value $b$ as both true and false. Well, to begin with, application of the transplication connective's behaviour to the truth value $b$ forces a step outside of the 3 -valued system into a 4 -valued system, with truth values $n$ (again neither true nor false) plus $b$. This transplication connective thus finds a home in the many-valued logic FDE (First Degree Entailment) system. The truth table for this connective is:

| $/$ | 1 | $b$ | $n$ | 0 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1 | $b$ | $n$ | 0 |
| $b$ | 1 | $b$ | $n$ | 0 |
| $n$ | $n$ | $n$ | $n$ | $n$ |
| 0 | $n$ | $n$ | $n$ | $n$ |

Here are the results for the transplication connective based on the logic $F D E$, which turns out to be the same as that for the transplication connective based on Strong Kleene logic:

| $(1) q \vDash p / q$ | $\times$ |
| :--- | :---: |
| $(2) \neg p \vDash p / q$ | $\times$ |
| $(3)(p \wedge q) / r \vDash(p / r) \vee(q / r)$ | $\sqrt{ }$ |
| $(4)(p / q) \wedge(r / s) \vDash(p / s) \vee(r / q)$ | $\sqrt{ }$ |
| $(5) \neg(p / q) \vDash p$ | $\sqrt{ }$ |
| $(6) p / r \vDash(p \wedge q) / r$ | $\times$ |
| $(7) p / q, q / r \vDash p / r$ | $\checkmark$ |
| $(8) p / q \vDash \neg q / \neg p$ | $\times$ |
| $(9) \vDash p /(q \vee \neg q)$ | $\times$ |
| $(10) \vDash(p \wedge \neg p) / q$ | $\times$ |
